# MORE TIME

**54 OUT OF 54**

healthcare providers whose adult patients used the MiniMed™ 670G system reported that it is better than any previous therapy they have used.<sup>1</sup>

**96%**

of previous adult multiple daily injection (MDI) users reported that the MiniMed™ 670G system met or exceeded expectations for improved blood glucose control.<sup>2†</sup>

† Due to inherent study limitations, caution is advised when attempting to extrapolate these results to new patients. There could be significant differences.  
§ When compared to multiple daily injections.

## USING A PUMP MEANS 90% FEWER INJECTIONS

† Assumes 4 injections per day for 30 days.  
‡ Assumes one infusion site change every 2 to 3 days.

## INTRODUCING THE MINIMED™ 670G SYSTEM.

Fluctuating glucose levels make it tough for your child to maintain energy at school, enjoy sports, and get a good night's sleep.

But now, revolutionary pump therapy from Medtronic can help keep your child's glucose levels in range automatically, day and night.\*

By automating glucose delivery, the MiniMed™ 670G system helps increase the percentage of time that your child's glucose levels are between **3.9-10mmol/L** per unit of time.<sup>3</sup>

**Helps improve time in range, meaning they can spend less time worrying about their glucose levels and more time just being a kid.**

# IN RANGE<sup>2§</sup>

## ADAPTIVE INSULIN THERAPY

Just like a thermostat automatically adjusts to maintain the temperature in your home despite the temp outside, the MiniMed™ 670G system customises your child's background insulin based on their activities, day and night, to help **minimise the risk of dangerous highs and lows.**

Your child's daily insulin requirements are unique. **ONLY** the Adaptive Insulin Therapy of the MiniMed™ 670G system automatically adjusts background insulin delivery **every 5 minutes to match your daily needs.\***

\* Refers to Auto Mode. Some interaction required. Individual results may vary.

## AUTOMATICALLY ADJUSTS TO YOUR CHILD'S LIFE.\*

- Monitors your child's glucose levels day and night to self-adjust background insulin based on their needs<sup>4</sup>
- Accurate sensor that patients trust<sup>5</sup>
- Convenient pump and discreet sensor
- Waterproof††
- Customisation options
- Site change and meal reminders

\* Refers to Auto Mode. Some interaction required. Individual results may vary.

#### Indications

The MiniMed™ 670G system is intended for continuous delivery of basal insulin (at user selectable rates) and administration of insulin boluses (in user selectable amounts) for the management of Type 1 diabetes mellitus in persons age seven and older requiring insulin as well as for the continuous monitoring and trending of glucose levels in the fluid under the skin. The MiniMed™ 670G system includes SmartGuard™ technology, which can be programmed to automatically adjust delivery of basal insulin based on continuous glucose monitoring (CGM), and can suspend delivery of insulin when the SG value falls below or is predicted to fall below predefined threshold values. The Guardian Sensor (3) is not intended to be used directly for making therapy adjustments, but rather to provide an indication of when a fingerstick may be required. All therapy adjustments should be based on measurements obtained using a home glucose monitor and not on values provided by the Guardian Sensor (3).

#### WARNINGS

##### Important Safety Information: MiniMed™ 670G System

The safety of using Auto Mode, Suspend before low, and Suspend on low in people who have no pump experience is not known. Auto Mode, Suspend before low, and Suspend on low should not be used if insulin pump settings have not been previously established. Insulin pump settings include basal rates, insulin to carb ratio, or insulin sensitivity factors. Always discuss with your healthcare professional before using Auto Mode, Suspend before low, or Suspend on low.

Do not make treatment decisions, such as determining your insulin dose for meals, using the MiniMed 670G system CGM values, as they are not intended to be used to make such treatment decisions. The MiniMed 670G system CGM does not replace a BG meter. Always use the values from your BG meter for treatment decisions. BG values may differ from SG values. Using the SG readings for treatment decisions could lead to high or low BG.

Do not use Auto Mode for a period of time after giving a manual injection of insulin by syringe or pen. Manual injections are not accounted for in Auto Mode. Therefore, Auto Mode could deliver too much insulin. Too much insulin may cause hypoglycaemia. Consult with your healthcare professional for how long you need to wait after a manual injection of insulin before you resume Auto Mode.

#### Contraindications

Medtronic performed an evaluation of the MiniMed 670G system and determined that it may not be safe for use in children under the age of 7 because of the way that the system is designed and the daily insulin requirements. Therefore this device should not be used in anyone under the age of 7 years old. This device should also not be used in patients who require less than a total daily insulin dose of 8 units per day because the device requires a minimum of 8 units per day to operate safely.
